Security in a Mobile App World

April 2015 AISA meeting

One of the largest shifts in product and application development over the past few years has been the explosion of mobile apps. Like many innovations in the IT space, security can often be late to the party, and this has been similar with the growth of mobile app development. While application security professionals are now starting to get a full grasp on applying security through the systems development lifecycle, the changes that come from the mobile space push the target a step away.

The Open Web Application Security Project (OWASP) is a not-for-profit organisation that aims to bring application security resources to the world for free. A number of OWASP projects can assist with development.

Interested in keeping abreast of the application of security within a mobile app's development lifecycle? Keen to get an update on OWASP? In this month's joint AISA/OWASP presentation, Christian will discuss some of the older projects that still apply in a mobile app world, and some of the newer upcoming projects

This month's event is sponsored by EY and Asterisk

About the presenter

Christian Frichot is a founder and principal at Asterisk Information Security and one of the Perth Chapter Leads for OWASP. He has been a contributor to a number of OWASP projects for over five years and has published tools, particularly related to the Software Assurance Maturity Model. Christian spends considerable time in the models' Development Testing and Code Review guides. He also uses his knowledge of application development and testing as founder and principal at Asterisk Information Security.

A presenter and author, Christian loves discussing security - especially its overlaps into application development.

► **Date:** Tuesday, 14 April 2015

► **Location:** The Ernst & Young Building, 11 Mounts Bay Road

► **Time:** 5.15pm

► **RSVP:** by 10 April 2015 via the AISA website
